

Week 11 Mock Interview - Self-Reflection

Stanley Metone

During the mock interview, I communicated my technical background and used the KPC Secure AI Tooling Pipeline to connect analytics work to operational value. I explained the problem, my role as project lead, the team structure, and the financial case in a way that focused on cost, risk and decision-making rather than technical detail. My strongest answers were those where I used a situation, action and result structure, especially when discussing teamwork, data quality and project leadership. I maintained a professional tone and asked clarifying questions before answering broad prompts. The main improvement area is concision. Some answers became longer than necessary because I tried to include detail. I need to lead with the result, then give only the evidence needed to support it. I also need stronger examples for conflict resolution, failure and stakeholder disagreement, using specific actions and outcomes rather than general statements. Before my next interview, I will practise ninety-second answers, rehearse the ROI calculation until it is automatic, and prepare three adaptable STAR stories. I will also record myself once more to improve pacing, eye contact and confidence. Overall, the session showed that my strongest differentiator is translating analytics into operational decisions and measurable business impact.
